Demolition

We are experts in the science of precise and safe removal of obsolete structures, their components, and architectural finishes. We understand the unique intricacies involved in demolition contracting, and employ innovative, successful techniques in the areas of historical preservation, interior renovation, selective dismantling, or total demolition.

Duct Cleaning

Duct cleaning involves the clean up of various heating and cooling system components of forced air systems. The process is simple. First we use specialized tools to dislodge dirt and debris. Then we vacuum them out with a high-powered HEPA vacuum cleaner. Once cleared of debris, we sanitize all surfaces and apply chemical sealants to inhibit future contamination and help reduce energy costs.

Mold Remediation

Our professionals are trained to identify the sources of the problem, and create a plan for its effective and safe removal. Cleanup and repair of the physical structure affected requires careful planning, proper equipment and skilled technicians. All of our inspectors and remediators are certified in their fields, have extensive knowledge of the building industry, and use the most state-of-the-art methods and equipment to eliminate the problem and restore the building to a healthier operation.

Asbestos and Lead Abatement

Simpson Environmental Services and its management team have been involved in the asbestos/lead abatement industry since 1977. We utilize an independent third-party to verify air monitoring and sampling. We also maintain specific liability insurance of the occurrence type that is far superior to the "claims made" types of policies.

Safety is a top priority at Simpson Environmental

Our key supervisory and management personnel, as well as our workers, are indoctrinated into our safety program immediately upon employment. Regular safety meetings are an integral part of our training. Toolbox talks, independent safety audits, and various worker training programs ranging from the National Asbestos Council to certified consulting from accredited universities are part of our ongoing safety program requirements. In addition, SES is a drug-free workplace.

Documentation

We dot all our i's and cross all our t's. Before, during and after any project, documentation is of critical importance. A biography of events and documents needs to be meticulously compiled to record absolute proof of project events. The tangible evidence of compliance with regulations, coupled with our state-of-the-art equipment, procedures and practices, is your best defense in the event of future inquiry or legal action. In addition, we properly administer documented quality control programs to ensure all jobs are done correctly and cost-effectively.
